Quick Change Discs

In the Aerospace Industry

“Fast Convenient Solution to a range of applications”

The Garryson range of quick change products is UNIQUE, including innovative products such as Flexidisc, Minidisc and MX as well as the more conventional sanding discs and non-woven discs.

Application

The aerospace industry has very exact standards for the quality of finish on all components. There is also a huge variety in the number, and type of components in the industry.

Removal of machining marks in aluminum components such as wingspars is the perfect application for quickchange products. The convenient QC locking system allows rapid changeovers of product, which minimises non-value-added downtime.

The different sizes, grits and types of product available in the system allows the optimum product to be used dependent on the particular component and job; all the products in the family are compatible with a single machine tool, fitted with a quick change holder.

TIP

When using QC products, ensure the use of the correct holder for the diameter, and run the products on a suitable right angled die grinder at the correct speed.
